Abstract

Plants are the most important living systems for the existence, survival and sustenance of all the living beings, including human beings, on the planet earth. It is the plants that are capable of converting the radiant energy from the sun into chemical energy needed for all life processes. The plants thus are responsible for the air that we breath, water that we drink, food that we eat(including food of animal origin ,since the primary producer in the food chain are plants),cloths that we put on, the house that provide us shelter, the medicine that cures us .For our normal needs 33% of the earths cover has to be forests. If we cut trees indiscriminately, it is bound to lead us in misery. The paper describes the brainless without planning deforestation in Jharkhand including cutting of age old trees on the road side in its capital on the pretext of expansion of road width and suggests the alternative ways of development while maintaining plant life percentage.

Key words: *Universe, living system, photosynthesis, transpiration, biotechnology, totipotency, deforestation.*
